

MATH 323 - ASSIGNMENT 3

Please submit your assignment by 11.59 pm on Friday 9th November by uploading a pdf to myCourses.

NOTE THAT THIS ASSIGNMENT CARRIES 30 MARKS, AND WILL COUNT 1.5 TIMES AS MUCH AS ASSIGNMENTS 1 AND 2.

1. Suppose Y is a continuous random variable that has an Exponential distribution with parameter β :

$$f(y) = \frac{1}{\beta} e^{-y/\beta} \quad y > 0$$

and $f(y) = 0$ otherwise.

- (a) Compute the following probabilities:

(i) $P(Y \leq 2)$ if $\beta = 1$. 2 MARKS

(ii) $P(Y > 4)$ if $\beta = 2$. 2 MARKS

(iii) $P(Y > 4|Y > 2)$ if $\beta = 1$. (Hint: use the definition of conditional probability). 2 MARKS

(iv) $P(Y = 3|Y > 2)$ if $\beta = 4$. 2 MARKS

- (b) Now suppose that we define the new random variable $X = 3Y$. Find the pdf of X . 2 MARKS

2. Suppose Y is a continuous random variable that has a Normal distribution with parameters $\mu \in \mathbb{R}$ and $\sigma \in \mathbb{R}^+$:

$$f(y) = \frac{1}{\sigma\sqrt{2\pi}} \exp \left\{ -\frac{1}{2\sigma^2} (y - \mu)^2 \right\}$$

for $y \in \mathbb{R}$.

- (a) Using the Normal probability tables (attached, also see page 2.), compute the following probabilities:

(i) $P(Y \leq 2)$ if $\mu = 0, \sigma = 1$. 2 MARKS

(ii) $P(Y > 1)$ if $\mu = 1, \sigma = 1$. 2 MARKS

(iii) $P(Y > 0|Y > 2)$ if $\mu = 0, \sigma = 4$. (Hint: use the definition of conditional probability). 2 MARKS

(iv) $P(Y > 2 \text{ or } Y < -1)$ if $\mu = 0, \sigma = 2$. 2 MARKS

- (b) Now suppose that we define the new random variable $X = 2Y - 1$. Find the pdf of X .

2 MARKS

In the Normal probability tables, the entries in the table are either $P(Y \leq y)$ (in Part I) or $P(Y > y)$ (in Part II) for $y > 0$ if Y has a standard Normal distribution. As the pdf is symmetric, we have that for $y > 0$,

$$P(Y > y) = 1 - P(Y \leq y) = P(Y \leq -y).$$

Figure 1: Left panel: Shaded area is $P(Y \leq 1.14)$ – see Part I. Right panel: shaded area is $P(Y > 1.14)$ – see Part II.

3. Suppose Y is a continuous random variable that has a pdf given by

$$f(y) = c \exp\{-y - e^{-y}\}$$

for $y \in \mathbb{R}$ for some constant c , and cdf

$$F(y) = \int_{-\infty}^y c \exp\{-t - e^{-t}\} dt = c \exp\{-e^{-y}\}$$

for $y \in \mathbb{R}$.

(a) Write down the value of c . 2 MARKS

(b) Compute $P(Y > 1)$. 3 MARKS

(c) Find the pdf of random variable $X = e^{-Y}$, and hence identify the distribution of X . 5 MARKS

Hint: For $x > 0$,

$$P(X \leq x) = P(e^{-Y} \leq x) = P(Y \geq -\ln x).$$

Table of the standard Normal distribution: Part I

Entries in table are $P(Z \leq z)$
